

WebDev #3

I have a website that needs a small addition and a few bug fixes. It's built with **Next.js** — would you be able to take on this work?

1. In addition to the bugs, I need to **add a couple of links to the navigation bar** and **automate starting the Kroki server together with the site**—essentially, write a **small bash script** to bring the site up with a single command.

How to run the `kroki` Plugin Locally with Docker:

To run the `kroki` plugin locally with Docker, follow these steps:

- Download and install Docker on your local machine.
- Open a terminal and run the following command.
- ``docker run -p 8000:8000 yuzutech/kroki``.
- This will start the `kroki` server locally on port 8000 (You can change the port if needed like ``8001:8000``).
- Add the following line to your ``.env`` file with the correct server URL and port:
- ``NEXT_PUBLIC_KROKI_SERVER_URL='http://localhost:8000'``
- If you want to use the `kroki` plugin in production you must instead add the following line to your ``.env`` file:
- ``NEXT_PUBLIC_KROKI_SERVER_URL='https://kroki.io'``

How to run the `kroki` Plugin Locally with Docker Compose:

To run the `kroki` plugin locally with Docker Compose, follow these steps:

- Download and install Docker on your local machine.
- Add the following line to your ``.env`` file with the correct server URL and port listed in the ``docker-compose.yml`` file:
- ``NEXT_PUBLIC_KROKI_SERVER_URL='http://localhost:8000'``
- While in the project root directory where the ``docker-compose.yml`` file is located, run ``docker compose up``.
- This will then run both your Next.js app and the `kroki` server in docker containers.

- To use extra diagram types uncomment the lines in the `docker-compose.yml` file.

3. Adding ability to **choose a color theme** in **Settings** (including multiple Light and Dark themes).

Key Benefits

- Fully Private & Unlinkable**
- Legally Unattackable** (no accounts, no servers)
- Self-Stored Logic** via IPFS
- Autonomous Agents** (off-chain, programmable)
- Modular:** works with any digital asset, condition, or trigger
- Post-Quantum Cryptography from the box**

Core Components

Component	Role
<code>.vault.json</code>	Logic definition (conditions, triggers, actions)
<code>Move Contract</code>	On-chain claim & proof validation
<code>Agent</code>	Executes logic off-chain, handles time, zk, webhooks
<code>IPFS Storage</code>	Stores logic and payloads permanently
<code>Ring Signature</code>	Enables anonymous claiming
<code>Key Image</code>	Prevents double-spending
<code>View Key</code>	For audit if needed

Its OK on Daisy Color theme BUT
not in Dark ColorTheme
